The MAGIC Foundation is a national nonprofit organization created to provide support services for the families of children afflicted with a wide variety of chronic and/or critical disorders, syndromes and diseases that affect a child’s growth. Some of the diagnoses are quite common while others are very rare.

MAGIC continues and develops through membership fees, corporate sponsorship, private donations and fundraising.

Constitutional Delay of Growth and Puberty

Not an illusion or magical, but the caring for children and their families

*Dedicated to the growth and overall development of children*

Revised 2016
What is Constitutional Delay of Growth and Puberty?

One of the most common diagnoses made after a growth evaluation is constitutional delay of growth and puberty. These children, often called “late bloomers”, have a characteristic pattern of growth. Constitutional delay of growth and puberty (CDG) is a variant of normal growth, rather than a “disease process”.

Children with constitutional delay of growth and puberty are typically born with a normal birth weight and length, but in the first few years of life, they show slow growth and thus lose height percentiles. There may be delayed dental development in childhood. A similar pattern of growth was often experienced by a parent. For example, the mother might recall her first menstrual cycle occurring late, such as after age 15, or the father might recall being short but catching up towards the end of high school.

Constitutional delay of growth and puberty is diagnosed more frequently in boys than girls but can occur in either sex. The growth rate between ages 3 and 10 should be normal so there should not be a further loss in percentiles. If there is a concern about the growth rate, further evaluation is recommended. However, when peers go through pubertal growth acceleration, children with constitutional delay of growth and puberty will lose percentiles as their onset into puberty is delayed.

Bone age (x-ray of the left hand and wrist) is delayed in CDG, but is also delayed in many other conditions. Thus, a delayed bone age supports the diagnosis of constitutional delay of growth and puberty, but is not conclusive.

Should I take my child to see a growth specialist?

Your primary care team will help decide whether a consultation is needed. You should point out whether there was a similar pattern of growth in any of the family members.

Questions to ask your Primary Care Physician

- Is my child short but growing well, such as at least 2¼ inches per year?
- Do you think the growth pattern is consistent with constitutional delay or suggestive of another diagnosis?
- Is the bone age or skeletal age delayed? Does it look like my child will catch up to his/her genetic potential?

How is Constitutional Delay of Growth Diagnosed?

Your primary care team can diagnose CDG, though sometimes a consultation with an endocrinologist is sought to confirm the diagnosis.

What should I expect at the endocrinologist’s office?

The endocrinologist will take a detailed family history of heights and get an appreciation of the timing of the growth spurt of other family members. You can help out by asking grandparents about their height and timing of pubertal development.

Hand carry a copy of the growth charts. The more information you provide, the more accurate will be the assessment.

A detailed examination will be performed including a brief assessment of how far along your child is in terms of pubertal development.

There may be no laboratory tests requested, or there might be a bone age x-ray of the left hand and wrist as well as a blood test screening for other tests that can mimic constitutional delay of growth and puberty. There is no specific blood test to diagnose constitutional delay of growth and puberty.
